AB It is intended to provide a cosmetic composition for use in warm peeling-massage, which is smoothly stretchable on the skin, and excellent in skin-warming effect and skin dirt-removing effect with good storage stability. Disclosed is a composition for use in warm peeling-massage, characterized by consisting of a 1st agent containing a dissoln. heat-generating salt, e.g. calcium chloride and magnesium chloride (hydrate), and a 2nd agent containing glycerin, a glycerin-modified silicone, a salt-sensitive water-sol. polymer, and

10/959,630

water. The 1st and 2nd agents were mixed before applying to the skin. For example, a 1st agent containing calcium chloride dihydrate 30 parts, fragrant/preservative q.s., and talc q.s., and a 2nd agent containing glycerin 30, a glycerin-modified silicone (KF-6100) 1, pectin (Genu pectin type LM-104AS-J) 1, pigment/preservative q.s., and water 35 parts were formulated, and mixed.

AB A stable semipermanent hair dye composition comprises (1) direct dyes, (2) hydrocarbon oils, (3) polyoxyalkylene-modified dimethylpolysiloxane, (4) dimethylpolysiloxane, and (5) water-sol. polymers, wherein the weight ratio of (2) to (3) + (4) is 0.01-100, and the weight ratio of (4) to (3) is 0.01-100. The dye compns. may further comprise organic solvents, such as aromatic alcs., lower alkylene carbonate, N-alkylpyrrolidone, formamides, and/or lactones. For example, a hair dye composition contained Japan Red 106 0.05, Japan Violet 401 0.05, light isoparaffins 5, KF-6005 1, dimethylpolysiloxane (average polymerization degree 2700) 0.5, dimethylpolysiloxane (average polymerization degree 550) 1.5, xanthan gum 2, 2-benzyloxyethanol 2.5,  $\gamma$ -caprolactone 7.5, lactic acid (90 % solution) 5, malic acid (50 % solution) 0.1, ethanol 5, concentrated glycerin 5, 1,3-butylene glycol 0.1, additives q.s., and water to 100 %,.

AB Polymer-based hair care emulsions contain plant protein hydrolyzates (mol. weight 10,000-500,000). As emulsifiers, alkyl dimethicone copolyols are used. Thus, an oily phase contained Abil EM90 2.5, ethoxylated hydrogenated castor oil 2.5, isohexadecane 6.0, caprylic/capric triglyceride 4.0, iso-Pr myristate 4.0 and protein hydrolyzates from Pisum sativum 1.0%. The aqueous phase comprised 1,2-propanediol 2.0, MgSO<sub>4</sub>·7H<sub>2</sub>O 0.7, glycerin 4.0, Aquaflex FX64 5.0, and water to 100%.

AB Me H siloxanes were treated with 10-undecenoic acid and neutralized with CsOH to give water-sol. polymers. The polymers lowered the surface tension of aqueous solns. and associated in solution to give aggregates 200-800 Å in diameter. The polymers formed isotropic rather than anisotropic phases. The siloxane having the greatest degree of undecanoate functionalization was the most water soluble, had the largest aggregate size, and formed a viscous isotropic liquid-crystalline phase at high concns. in water.

AB Denture stabilizers contain di-Me siloxane (50-15,000,000 cPs at 25°) and water-sol. polymers. The stabilizers show good adhesion property for a prolonged time, do not have unpleasant taste, and are easily removed from denture after use. Di-Me siloxane (7,000,000 cPs) 50, poly(ethylene oxide) 30, and CMC Na 20 weight parts were mixed to give a denture stabilizer.

AB Organopolysiloxanes are prepared by the controlled condensation of organosilanols in the presence of an anhydrous K salt of a weak acid. Thus, Et<sub>2</sub>Si(OH)<sub>2</sub> was polymerized to a viscous oil with loss of water by heating at 150° at 5 mm. in the presence of anhydrous K<sub>2</sub>CO<sub>3</sub>. Et<sub>2</sub>Si(OH)<sub>2</sub> and Ph<sub>2</sub>Si(OH)<sub>2</sub> were copolymerized by heating in the presence of K<sub>2</sub>CO<sub>3</sub> at 100° at 5 mm. Et<sub>2</sub>SiCl<sub>2</sub> (4 moles) was hydrolyzed in 3000 cc. Me<sub>2</sub>CO and 900 g. Na<sub>2</sub>CO<sub>3</sub>, filtered, the solvent removed, and heated for 3 hrs. at 5 mm. with 25 g. K<sub>2</sub>CO<sub>3</sub>. The resulting polymer was elastic. SiOR linkages are retained.

AB Hydroxyphenylbenzophenone derivs. (I; R1, R2 = H, C1-20 alkyl, C2-20 alkenyl, C3-20 cycloalkyl, C3-10 cycloalkenyl; R1-R2 together with linking N form 5-/6-membered heterocycle; R3, R4, R5 = C1-4 alkyl, C1-4 alkoxy, OSi(R6)3; R6 = C1-6 alkyl; A = C3-6 alkylene, optionally interrupted by one or more O or O(CO); m = 0-5) and a process for their preparation are provided. The compds. have outstanding solubility properties in oils and are useful in cosmetic formulations as UV filters for protecting skin and hair from the harmful effects of UV radiation. Thus, compound II was prepared and formulated in a water-in-silicone composition as a soluble UV-A filter. The composition contained isononyl isononanoate 2.80, cetyl dimethicone 4.00, silica di-Me silylate 1.00, ethylhexyl methoxycinnamate 0.30, octocrylene 8.00, compound II 3.00, bis-ethylhexyloxyphenol methoxyphenyl triazine 3.50, cyclomethicone 1.50, dimethicone 12.00, dimethicone (and) dimethicone/vinyl dimethicone crosspolymer 5.00, titanium dioxide (and) aluminum hydroxide (and) dimethicone/methicone copolymer (and) hydrated silica 1.00, water 1.50, sodium chloride 3.00, and butylene glycol to 100%, resp. The in vitro measurement showed high SPF value (SPF 30) and high UVA protection (UVA balance 20).

AB A cosmetic removal composition suitable for removing "permanent" or long lasting color cosmetics is described. The composition comprises at least one silicone crosspolymer with solvent properties. Thus, a cosmetic makeup remover comprised cyclopentasiloxane and dimethicone/vinyl dimethicone crosspolymer 89.0%, dioctyldodecyl dimer dilinoleate and omega-6-linoleic acid 0.50%, ceramide-3 0.50, and octyl cocoate 10.0%.

AB The combination of an elastomeric powder with silicone acrylate copolymer containing lipstick has been shown to increase the resistance of the lipstick. In particular, the combination of either 5% or 10% of dimethicone /vinyl dimethicone crosspolymer and silica with 27.8% of acrylates/polytrimethylsiloxymethacrylate copolymer in cyclopentasiloxane, in a lipstick results in an increase in color and an increase in resistance.

AB A preparation in the form of a water-in-oil emulsion which contains at least one silicone, at least one PEG/PPG dimethicone with 15 to 20 units of PEG and PPG, resp., as an emulsifier, a lipid phase, water in a proportion of 0.1 to 5% with respect to the total weight of the composition and at least one particulate ingredient is described. Thus, a pearl lip color was prepared containing by parts PEG/PPG-19/19 dimethicone 16.00, cyclopentasiloxane 14.80, trisiloxane 38.050, polyethylene (micronized) 1.80, carnauba wax (micronized) 2.20, mica and titanium dioxide (CI No 77891) 11.00, iron oxides (CI No 77491, CI Number 77492 and CI No 77499) 1.30, silica 4.80, gel A (cyclopentasiloxane and disteardimonium hectorite) 5.00, gel B (isodecyl neopentanoate/cyclopentasiloxane/stearalkonium bentonite/propylene glycol/dimethicone-vinyl dimethicone crosspolymer) 3.00, phenoxyethanol 0.50, methylparaben 0.15, ethylparaben 0.025, propylparaben 0.075, fragrance 0.20, tocopherol 0.10, and water 1.00. The preparation was strongly shiny, copper-colored, highly viscous paste which nonetheless can be easily distributed on the skin, of a viscosity of 3000 Pa·s.

AB The present invention relates to production and use of polymer particles where the polymer comprises poly( $\beta$ -amino acids), polylactates, polythioesters, or polyesters, and in particular polyhydroxyalkanoates (PHA) or more specifically poly(3-hydroxybutyrate). In particular the invention relates to functionalized polymer particles, processes of production, and uses thereof. Production of polymer particles are produced by recombinant host cells transfected with expression constructs comprising at least one nucleotide sequence encoding a polymer synthase and at least one nucleotide sequence encoding a fusion protein of polymer synthase and at least one fusion partner, and optionally addnl. fusions of polymer particle-binding domains and a fusion partner. The method is exemplified by the preparation of PHA particles displaying fusion polypeptides comprising phasin (PhaP from *Ralstonia eutropha*) and mouse oligodendrocyte glycoprotein (MOG) or interleukin-2, or a fusion polypeptide comprising an antibody binding the ZZ domain of *Staphylococcus aureus* protein A. The methods, polymer particles and fusion proteins of the present invention have utility in diagnostics, protein production, biocatalyst immobilization, and drug delivery.

AB A sun block cosmetic composition is provided to improve sun blocking activity, water resistance, and transparency, and reduce glossy or sticky properties. The sun block cosmetic composition comprises 0.01-30 part by weight

of organic polysiloxane elastomer as a gelling agent and 1-45 parts by weight of

organic sunscreen, wherein the organic polysiloxane elastomer is dimethicone/vinyl dimethicone crosspolymer; and the organic sunscreen is selected from p-amino benzoic acid, octylmethoxy cinnamate, octylsalicylate, benzophenone, anthranilate, octocrylene, butylmethoxybenzoyl methane, oxybenzone, octyltriazone, Me anthranilate, 3,4-methylbenzylidene camphor and bis-ethylhexyloxyphenolmethoxy phenyltriazine.

AB The present invention relates to a cosmetic composition particularly useful for the application of color such as in a foundation, lipgloss, lipstick, eyeshadow, mascara, blush and nail polish. The cosmetic composition comprises a film-forming silicone-containing polyurethane having a viscosity of about 130,000 to about 2,500,000 cps being present in an effective amount to impart long lasting transfer resistant film when applied to a surface of the human body. The film-forming silicone-containing polyurethane has an isocyanate content of about 10 ppm or less. Thus, a long-wearing lip color system was provided comprising (i) a color part containing isodecane 50, bis-PEG-dimethicone-polypropylene glycol-IPDI copolymer 20, Bentone Gel-isododecane/disteardimonium hectorite/propyl carbonate 10, fragrance 0.20, acrylate copolymer 0.20, tetradibutyl pentaerithrityl hydroxyhydrocinnamate 0.05, titanium dioxide 4.12, Iron oxide red 34-2045 2.38, D&C Red Number 6 Barium Lake 0.90, sericite 2.55, dimethicone /vinyl dimethicone/crosspolymer/silica blend 9.1, and caprylyl glycol 0.50, and (ii) a clear part containing polybutene 66.84, hydrogenated polyisobutene 27.0, jojoba oil/gellants/BHT Hi viscosity 5.5, fragrance 0.20, hydroxystearic acid 0.26, and benzoic acid 0.20%, resp. The long-wearing color and the desired glossy finish were provided in a single application, such as in a lipstick or a liquid lip color applied with a wand or brush. Alternatively, a long-wearing lip color was a two-part system, wherein the first part applied to the lips contained the color and, once dried, a second clear part was applied over the color.

OTHER SOURCE(S):

MARPAT 145:362880

AB The present invention relates to a water-in-silicone emulsion for topical administration of a retinoid and/or peptide complexed with a copper ion. Thus, a water-in-silicone emulsion containing retinol was prepared comprising

10/959,630

dipropylene glycol 13, cyclopentasiloxane (and) cyclohexasiloxane 17.3, cyclopentasiloxane (and) dimethicone/vinyl dimethicone crosspolymer 12, dimethicone (and) dimethicone PEG 10/15 crosspolymer 6.25, isononyl isononoate 3, adipic acid/diethylene glycol/glycerin crosspolymer 2, squalene 1, bisabolol 1, oat (Avena sativa) kernel extract 0.9, ethylhexylglycerin 0.7, glycerin 0.5, sodium chloride 0.5, sodium citrate 0.2, erythorbic acid 0.1, dipotassium glyccyrrhizate 0.1, retinol 0.1, BHT 0.7, tocopherol 0.5, and water to 100%, resp. The permeation of retinol from the formulation prepared, with and without the film former adipic acid/diethylene glycol/glycerin crosspolymer, was compared in an in-vitro pig skin model study with a com. available oil-in-water emulsion containing 0.1% retinol. The efficiency of retinol permeation into the skin was unexpectedly increased by the water-in-silicone emulsion formulations as compared to the com. available oil-in-water emulsion. The presence of the film former affected the retinol absorption. Retinol permeation from the com. emulsion and emulsions with and without film former was 4.0%, 12.4%, and 18.1%, resp.
